

Renosly & 8secur — Setup Documentation

Domains: renosly.com, 8secur.com | Host: Hostinger | Registrar: GoDaddy
Checked and written 16 August 2026 | Prepared by Anirudha Talmale

1. Summary — where things stand

Both domains are now pointed at Hostinger and both are serving a website. One item is still outstanding: **8secur.com has no SSL certificate**, so it only works on `http://` and browsers will warn visitors. Everything else checks out.

*FR — Les deux domaines pointent maintenant vers Hostinger et affichent un site. Il reste un point : **8secur.com n'a pas de certificat SSL**, le site ne fonctionne donc qu'en `http://` et les navigateurs afficheront un avertissement. Le reste est correct.*

Check	renosly.com	8secur.com
Nameservers point to Hostinger	OK	OK
Domain resolves worldwide	OK	OK
Website loads	OK	OK (http only)
HTTPS / SSL certificate	OK — valid to 14 Nov 2026	MISSING
www redirects to main address	OK	Fails on https
Email routing (MX)	OK — Hostinger	OK — Hostinger
SPF (anti-spam record)	Present	Present
DKIM (mail signing)	Not published	Not published
Website content	Default WordPress	Default WordPress

2. The one thing that still needs doing

Install the SSL certificate on 8secur.com

Right now `https://8secur.com` does not complete a secure connection — the server has no certificate for that name, so the connection is refused before the page loads. Visitors who type the address with `https`, or who follow a link from Google or social media, will see a security warning instead of your site.

How to fix it (about two minutes):

1. Log in to Hostinger hPanel
2. Go to **Websites** and select **8secur.com**
3. Open **Security** → **SSL**

4. Click **Install SSL** (the free Let's Encrypt option is fine)
5. Wait 5-15 minutes, then open <https://8secur.com> to confirm

Once it is issued, also switch on **Force HTTPS** on the same screen so visitors are always sent to the secure address.

FR — Il faut installer le certificat SSL de 8secur.com : hPanel → Websites → 8secur.com → Security → SSL → Install SSL. Ensuite activez « Force HTTPS ». Comptez 5 à 15 minutes.

Two smaller recommendations

- **Publish DKIM for both domains.** SPF is in place but DKIM is not. Without DKIM, mail you send from these domains is more likely to land in spam. Hostinger publishes it for you: hPanel → Emails → the domain → DNS / DKIM settings.
- **Set a site title on both sites.** Both currently show the bare domain name as the page title because no title has been entered yet (WordPress → Settings → General).

3. What was changed, and in what order

Stage	What happened
Starting point	renosly.com was registered at GoDaddy and sat on GoDaddy's own nameservers (ns47/ns48.domaincontrol.com), showing the GoDaddy parking page. No website, no email.
Nameserver change	At GoDaddy, the domain was switched to custom nameservers ns1.dns-parking.com and ns2.dns-parking.com — Hostinger's.
Interim fault	For a period after that change the domain resolved to nothing at all : the nameservers had been handed over, but the domain had not yet been added inside the Hostinger account, so Hostinger's servers answered "no such domain". This is the normal consequence of doing the two steps out of order, and it clears as soon as the domain is added on the host side.
Domain added	Both renosly.com and 8secur.com were added to Hostinger. Hostinger moved them onto its CDN nameservers (aurora / nebula.dns-parking.com) and created full DNS zones — web, mail and SPF records.
Current state	Both domains resolve and serve a fresh WordPress installation. renosly.com has a valid SSL certificate; 8secur.com does not yet.

4. Verification — what was actually tested

Every line below was checked against public DNS (Cloudflare 1.1.1.1 and Google 8.8.8.8) and by opening the sites directly, not taken from a control panel screen.

Test	renosly.com	8secur.com
Nameservers (public DNS)	aurora / nebula .dns-parking.com	aurora / nebula .dns-parking.com
http:// request	301 → redirects to https	200 — loads
https:// request	200 — loads	Connection fails (TLS alert)
www over https	301 → main address	Connection fails
Certificate issuer	Let's Encrypt	None presented
Certificate covers	renosly.com + www.renosly.com	—
Certificate valid	16 Aug 2026 → 14 Nov 2026	—
Mail servers	mx1 / mx2.hostinger.com	mx1 / mx2.hostinger.com

One note on checking this yourself. If you test a domain shortly after a DNS change, your phone, your computer or your office router may still be holding the previous answer in memory for up to a few hours. That can make a site look alive when it is not, or dead when it is fine. The reliable test is to open the address on mobile data with wifi switched off, or simply to wait a few hours before drawing a conclusion.

FR — Après un changement DNS, votre téléphone ou votre box peut garder l'ancienne réponse en mémoire pendant quelques heures. Testez en 4G avec le wifi coupé.

5. DNS records on file

Full record exports are in the `dns/` folder of this pack, one text file per domain. Both domains carry the same structure: web records for the domain and `www`, Hostinger mail servers, and an SPF record.

Why the IP addresses change between checks. Hostinger serves these domains from a content delivery network, so the same lookup returns different addresses at different moments. That is by design — a different IP on a later check is not a fault.

renosly.com

Record	Value
Nameservers	aurora.dns-parking.com, nebula.dns-parking.com
A / AAAA	Hostinger CDN addresses (rotating)
www	CNAME → www.renosly.com.cdn.hstgr.net
MX	mx1.hostinger.com (5), mx2.hostinger.com (10)
SPF	v=spf1 include:_spf.mail.hostinger.com ~all
DKIM	Not published

8secur.com

Record	Value
Nameservers	aurora.dns-parking.com, nebula.dns-parking.com
A / AAAA	Hostinger CDN addresses (rotating)
www	CNAME → www.8secur.com.cdn.hstgr.net
MX	mx1.hostinger.com (5), mx2.hostinger.com (10)
SPF	v=spf1 include:_spf.mail.hostinger.com ~all
DKIM	Not published

6. How the sites look right now

Both are untouched WordPress installations with the default first post. There is no design or content on either yet — that is the next piece of work, whenever you want to start it.
